Go beyond earnings, and into value-based metricsBy Thomas P.I took a few courses with Professor Grant at the

University of Massachusetts Boston, where this was one of the required texts. I must say his courses and his texts has turned out to be most valuable and useful during my final years as a student of undergraduate finance. All of his texts were reader-friendly and insightful. Dr. Grant uses active companies in the stock market (GE, Dell, IBM) and their historical data to determine whether they are creating or destroying wealth for their shareholders and bondholders using value-based metrics like EVA. His calculations in this book were especially easy to follow and understand - students of finance can relate with me if you have read some of those cryptic finance texts. I would highly recommend Dr. Grant's text to all students. And if you are a UMass Boston student, you should take his course.

An updated look at the role of economic profit analysis in the process of wealth creation Grant explains the pivotal role of economic value added (EVA) in the theory of finance, how to measure EVA with standard accounting adjustments, how to use EVA to value companies and their stock, and how to use economic profit principles to identify wealth-creating firms, industries, and even market economies.
